1. A study of 31,000 hospital admissions in New York State found that 4% of the admissions led to treatment-caused injuries. One-seventh of these treatment-caused injuries resulted in death, and one-fourth were caused by negligence. Malpractice claims were filed in one out of 7.5 cases involving negligence, and payments were made in one out of every two claims.
 - (a) What is the probability a person admitted to the hospital will suffer a treatment-caused injury due to negligence? (5%)
 - (b) What is the probability a person admitted to the hospital will die from a treatment-caused injury? (5%)
 - (c) In the case of a negligent treatment-caused injury, what is the probability a malpractice claim will be paid? (5%)
2. The president of a company states that the average hourly wage of her employee is \$8.65. A random sample of 50 employees has the distribution shown. At $\alpha = 0.05$, is the president's statement believable? Assume $\sigma = 0.105$. (10%)

Class	Frequency
8.35-8.43	2
8.44-8.52	6
8.53-8.61	12
8.62-8.70	18
8.71-8.79	10
8.80-8.88	2

3. A manufacturer produces both a deluxe and a standard model of an automatic sander designed for home use. Selling prices obtained from a sample of retail outlets follow.

Retail Outlet	Deluxe	Standard	Retail Outlet	Deluxe	Standard
1	39	27	5	40	30
2	39	28	6	39	34
3	45	35	7	35	29
4	38	30			

The manufacturer's suggested retail prices for the two models show a

\$10 price differential. Use a 0.05 level of significance and test that the mean difference between the prices of the two models is \$10. (10%)

4. Ten observations were selected from each of 3 populations, and an analysis of variance was performed on the data. The following are the results:

Source of Variation	Sum of Squares	Degrees of Freedom	Mean Squares	F
Between Treatments	82.4	_____?	_____?	_____?
Within Treatments (Error)	158.4	_____?	_____?	
Total	_____?	_____?		

- (a) Complete all the missing values in the above table. (7%)
 - (b) Using $\alpha = 0.05$, test to see if there is a significant difference among the means of the three populations. (5%)
 - (c) If in Part (a) you concluded that at least one mean is different from the others, determine which mean is different. The three sample means are $\bar{x}_1 = 24.8$, $\bar{x}_2 = 23.4$ and $\bar{x}_3 = 27.4$. (6%)
5. The following results were obtained from a multiple regression analysis of supermarket profitability. The dependent variable, Y, is the profit (in thousands of dollars) and the independent variables, X_1 and X_2 , are the food sales and nonfood sales (also in thousands of dollars).

ANOVA		
	DF	SS
Regression	2	562.363
Residual	9	225.326
Total		

	Coefficients	Standard Error
Intercept	-15.0621	
X_1	0.0972	0.054
X_2	0.2484	0.092

- (a) Write the estimated regression equation for the relationship between the variables. (3%)
 - (b) Compute the coefficient of determination and fully interpret its meaning. (5%)
 - (c) Carry out a test of whether Y is significantly related to the independent variables. Use a 0.05 level of significance. (6%)
 - (d) Carry out a test to determine if there is a significant relationship between X_1 and Y. Use a 0.05 level of significance. (6%)
6. Although studies continue to show smoking leads to significant health problems, 20% of adults in the United States smoke. Consider a group of 250 adults.
- (a) What is the expected number of adults who smoke? (3%)
 - (b) What is the probability that fewer than 40 smoke? (5%)
 - (c) What is the probability that from 55 to 60 smoke? (5%)
7. According to Thomson Financial, through January 25, 2006, the majority of companies reported profits had beaten estimates. A sample of 162 companies showed 104 beat estimates, 29 matched estimates, and 29 fell short.
- (a) Determine the margin of error and provide a 95% confidence interval for the proportion that beat estimates. (7%)
 - (b) How large a sample is needed if the desired margin of error is 0.05? (7%)
