

科目：統計學

適用：財金系

考生注意：

1. 依次序作答，只要標明題號，不必抄題。
2. 答案必須寫在答案卷上，否則不予計分。
3. 限用藍、黑色筆作答；試題須隨卷繳回。

1. The records show that 8% of the items produced by a machine do not meet the specifications. Use the normal approximation to the binomial distribution to answer the following questions. What is the probability that a sample of 100 units contains
 - (a) Five or more defective units? (5%)
 - (b) Ten or fewer defective units? (5%)
2. At 2015, Department of the Banking and Finance, NCNU, surveyed 2,000 Web users and asked them about their willingness to pay fees for access to web sites. Of these, 400 were definitely not willing to pay such fees.
 - (a) Calculate the 95% confidence interval for the proportion definitely unwilling to pay fees. (5%)
 - (b) How large a sample size is necessary to estimate the proportion of interest to within 3% with 95% confidence? (5%)
3. A certain electronic system contains 8 components. Suppose that the probability that each individual component fail is 0.18 and that the components fail independently of each other. Given that at least one of the components has failed, what is the probability that at least two of the component have failed? (10%)
4. The percentage of adult users of the Internet who use Facebook has increased over time. Of adult Internet users age 18-49, 81% use Facebook. Of adult Internet users age 50 and older, 54% use Facebook. Assume that 52% of adult Internet users age 18-49.
 - (a) What is the probability that an adult Internet user uses Facebook? (4%)
 - (b) Given that an adult Internet user uses Facebook, what is the probability that he/she is age 18-49? (6%)
5. The amount of time required for an oil and filter change on an automobile is normally distributed with a mean of 45 minutes and a standard deviation of 10 minutes. A random sample of 16 cars is selected. 90% of the sample means will be greater than what value? (10%)

科目：統計學

適用：財金系

考生注意：

1. 依次序作答，只要標明題號，不必抄題。
2. 答案必須寫在答案卷上，否則不予計分。

6. In order to determine whether or not the sales of a company (y in millions of dollars) is related to advertising expenditures (x_1 in millions of dollars) and the number of salespeople (x_2), data were gathered for 10 years. Part of the regression results is shown below.

	<i>Coefficients Standard Error</i>			
Intercept	7.0174	1.8972		
x_1	8.6233	2.3968		
x_2	0.0858	0.1845		
ANOVA				
	<i>df</i>	<i>SS</i>	<i>MS</i>	<i>F</i>
Regression		321.11		
Residual (Error)		63.39		

- Use the above results and write the regression equation that can be used to predict sales. (4%)
 - Estimate the sales volume for an advertising expenditure of 3.5 million dollars and 45 salespeople. Give your answer in dollars. (4%)
 - At $\alpha = 0.05$, test to determine if the fitted equation developed in Part (a) represents a significant relationship between the independent variables and the dependent variable. (4%)
 - At $\alpha = 0.05$, test to see if β_1 is significantly different from zero. (4%)
 - Determine the multiple coefficient of determination. (4%)
 - Compute the adjusted coefficient of determination. (4%)
7. The use of preservatives by food processors has become a controversial issue. Suppose two preservatives are extensively tested and determined safe for use in meats. A processor wants to compare the preservatives for their effects on retarding spoilage. Suppose 15 cuts of fresh meat are treated with preservative I and 15 are treated with preservative II, and the number of hours until spoilage begins is recorded for each of the 30 cuts of meat. Both sampled populations are normally distributed. And, both samples are random and independent. The results are summarized in the table below.
- | | |
|---------------------------|------------------------------|
| Preservative I | Preservative II |
| $\bar{X}_I = 106.4$ hours | $\bar{X}_{II} = 96.54$ hours |
| $S_I = 10.3$ hours | $S_{II} = 13.4$ hours |

- (a) What is the value of the test statistic for testing if the population variances differ for preservatives I and II? At $\alpha = 0.05$, what is your conclusion? (8%)
- (b) What is the value of the test statistic for testing if the population means differ for preservatives I and II? At $\alpha = 0.05$, what is your conclusion? (8%)
8. For the United States, the mean monthly Internet bill is \$32.79 per household. A sample of 50 households in a southern state showed a sample mean of \$30.63. Use a population standard deviation of $\sigma = \$5.60$. Formulate hypotheses for a test to determine whether the sample data support the conclusion that the mean monthly Internet bill in the southern state is less than the national mean of \$32.79. At $\alpha = 0.05$, what is your conclusion? (10%)
