第 1 頁

1. The National Weight Control Registry tries to mine secrets of success from people who have lost at least 30 pounds and kept it off for at least a year. It reports that out of 2,700 registrants, 459 were on low-carbohydrate diets (less than 90 grams a day).
  - (a) Develop a 95% confidence interval for this fraction. (5%)
  - (b) Is it possible that the population percentage is 18%? (5%)
  - (c) How large a sample is needed to estimate the proportion within 0.5%? (5%)
2. The management of White Industries is considering a new method of assembling its golf cart. The present method requires 42.3 minutes, on the average, to assemble a cart. The mean assembly time for a random sample of 24 carts, using the new method, was 40.6 minutes, and the standard deviation of the sample was 2.7 minutes. Using the 0.10 level of significance, can we conclude that the assembly time using the new method is faster? (10%)
3. Clark Heter is an industrial engineer at Lyons Products. He would like to determine whether there are more units produced on the night shift than on the day shift. Assume the population standard deviation for the number of units produced on the day shift is 21 and is 28 on the night shift. A sample of 54 day-shift workers showed that the mean number of units produced was 345. A sample of 60 night-shift workers showed that the mean number of units produced was 351. At the .05 significance level, is the number of units produced on the night shift larger? (10%)
4. Television viewing reached a new high when the Nielsen Company reported a mean daily viewing time of 8.35 hours per household. Use a normal probability distribution with a standard deviation of 2.5 hours to answer the following questions about daily television viewing per household.
  - (a) What is the probability that a household views television between 5 and 10 hours a day? (5%)
  - (b) How many hours of television viewing must a household have in order to be in the top 3% of all television viewing households? (5%)

5. A survey showed that 8% of Internet users age 18 and older report keeping a blog. Referring to the 18-29 age group as young adults, the survey showed that for bloggers 54% are young adults and for nonbloggers 24% are young adults.
- (a) What is the probability that an Internet user is a young adult? (5%)
  - (b) What is the probability that an Internet user keeps a blog and is a young adult? (5%)
  - (c) Suppose that in a follow-up phone survey we contact someone who is 24 years old. What is the probability that this person keeps a blog? (5%)
  - (d) Suppose that in a follow-up phone survey we contact someone who is 50 years old. What is the probability that this person doesn't keep a blog? (5%)
6. The following output was obtained.

Analysis of Variance			
Source	DF	SS	MS
Regression	5	100	20
Residual Error	20	40	2
Total	25	140	

Predictor	Coefficient	SE Coef	t
Constant	3	1.5	2
x1	4	3	1.33
x2	3	0.2	15
x3	0.2	0.05	4
x4	-2.5	1	-2.5
x5	3	4	0.75

- (a) Compute the value of  $R^2$ . (5%)
- (b) Compute the multiple standard error of estimate. (5%)
- (c) Conduct a global test of hypothesis to determine whether any of the regression coefficients are significant. Use the 0.05 significance level. (5%)
- (d) Test the regression coefficients individually. Would you consider omitting any variable(s)? If so, which one(s)? Use the 0.05 significance level. (5%)

7. Country Financial, a financial services company, uses surveys of adults age 18 and older to determine if personal financial fitness is changing over time. In February 2012, a sample of 1000 adults showed 410 indicating that their financial security was more than fair. In February 2010, a sample of 900 adults showed 315 indicating that their financial security was more than fair.
- (a) Use  $\alpha = 0.05$ . Test to determine whether a significant difference between the population proportions for the two years. What is your conclusion? (10%)
- (b) What is the 95% confidence interval estimate of the difference between the two population proportions? (5%)
